E-COMMERCE SALES AND CUSTOMER ANALYTICS

Analyzing Sales Performance, Customer Trends and Business Insights using Power BI

Presented by Ayushi Nag

INTRODUCTION

E-commerce generates a large amount of data related to customers, products, orders, sales and payments. Analyzing this data helps businesses understand their performance and make better decisions.

OBJECTIVES

Objective 1

To analyze overall sales performance

To evaluate sales, profit, order count, and quantity to understand the overall performance of the e-commerce business.

Objective 2

To identify sales trends

To examine monthly and quarterly sales patterns and identify periods of high and low performance.

Objective 3

To understand customer & product behavior

To analyze payment preferences and product category performance to identify customer buying patterns.

Objective 4

To evaluate regional performance

To compare profitability across different regions and identify high- and low-performing areas for better business decisions.

IDEA ANALYSIS

Customer Insights

Understanding customer behavior and purchasing patterns.

Product Analysis

Identifying top-performing and underperforming product categories.

Payment Preferences

Understanding the most preferred payment methods.

Interactive Dashboard

Presenting key insights through an easy-to-use Power BI dashboard.

Sales Performance

Analyzing sales trends to identify business growth opportunities.

Regional Analysis

Comparing profitability across different regions.

Data Visualization

Transforming e-commerce data into clear and meaningful visuals.

Business Decision-Making

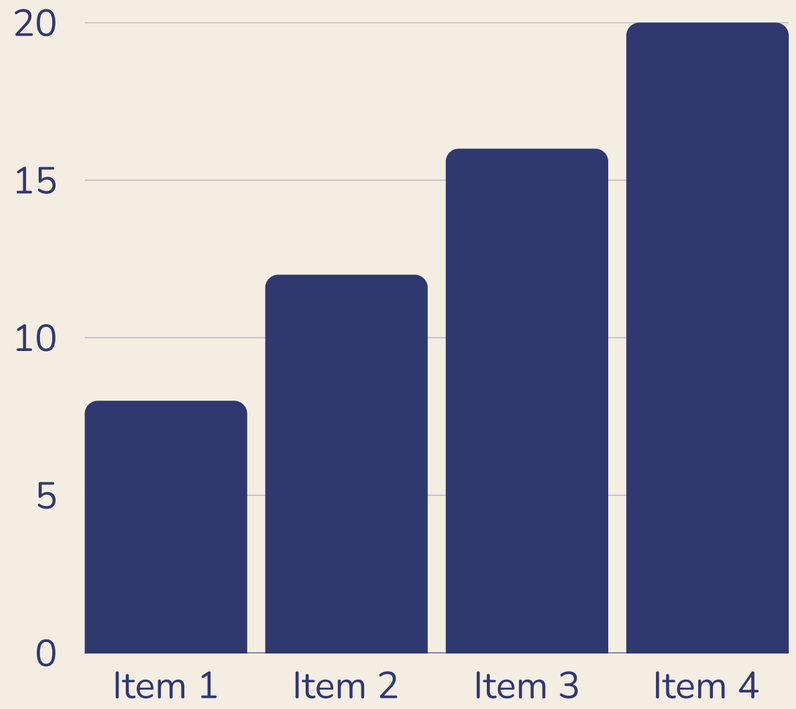

Using data-driven insights to support better business strategies.

E-COMMERCE SALES DATASET

The dataset contains 750 orders and provides information about customers, products, transactions and business performance.

Key data fields include:

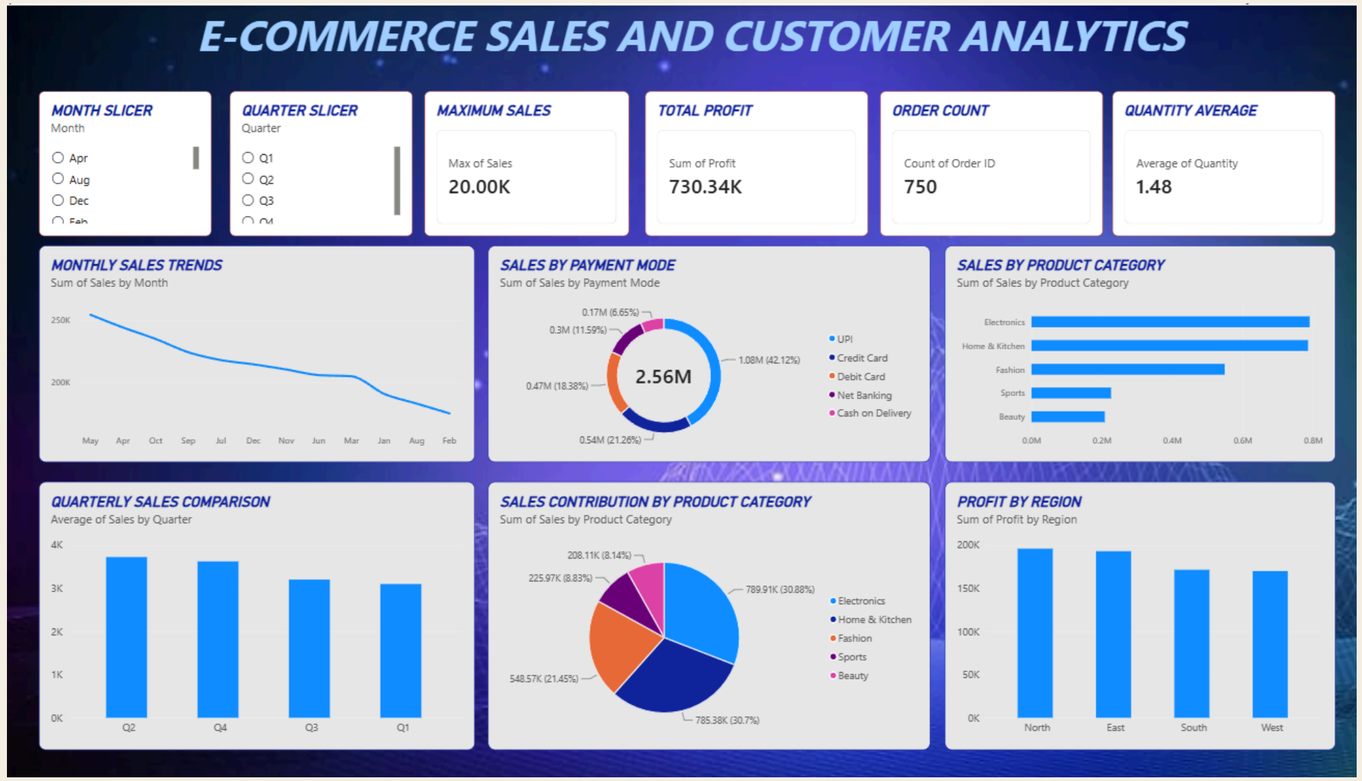

- Customer ID & Customer Name
- Age & Gender
- Product & Product Category
- Sales, Cost & Profit
- Quantity & Unit Price
- Region & State
- Payment Mode
- Sales Channel
- Order Status
- Month & Quarter

Why this data is useful:

It allows us to analyze the business from multiple perspectives, including sales, profitability, customers, products, payments and regions.

DASHBOARD OVERVIEW

KEY PERFORMANCE INDICATORS

Total Sales 2.56M

Overall revenue generated

Total Profit 30.34K

Overall profit generated

Order Count 750

Total number of orders

Average Quantity 1.48

Average quantity per order

Maximum Sales 20.00K

Highest recorded sales value

KEY BUSINESS INSIGHTS

Sales Trends

- May records the highest monthly sales.
- February shows comparatively lower sales.
- Q2 is the strongest-performing quarter.
- Sales fluctuate throughout the year.

Payment Preferences

- UPI – 42.12% → Most preferred payment mode
- Credit Card – 21.26%
- Debit Card – 18.38%
- Cash on Delivery – 6.65%

Product Performance

- Electronics – 30.88% → Top-selling category
- Home & Kitchen – 30.70%
- Fashion – 21.45%
- Sports & Beauty have lower contributions.

Regional Profitability

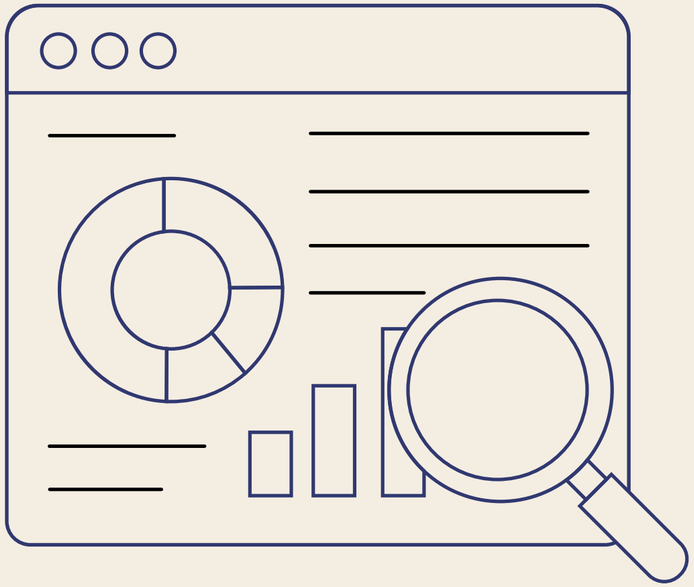

- North → Highest profit
- East → Second-highest
- South and West → Comparatively lower profitability

CONCLUSION

The E-Commerce Sales and Customer Analytics project successfully transforms raw business data into meaningful and easy-to-understand insights using Power BI. The analysis shows total sales of 2.56M, total profit of 730.34K, and 750 orders, indicating strong overall business performance. Electronics and Home & Kitchen are the leading product categories, while UPI is the most preferred payment method among customers. The sales analysis also highlights variations across months and quarters, with May showing strong monthly performance and Q2 being the strongest quarter. From a regional perspective, the North region generates the highest profit. Overall, the dashboard provides a clear view of sales, customers, products, payment preferences, and regional performance, helping businesses make better and more informed data-driven decisions.
